SO(IL) GOOD

**The benefits of soil
Presentation 😊**

I ACTUALLY GOT TO PRESENT AFTER SCHOOL!!

Instead of calling my friends like I've planned, my research teacher was kind enough to let me talk about my findings at her extra help, where groups of students always gather for their projects -So I got quite a cloud 😊

Project Green Challenge

Day 17

PRESENTATION

QUESTIONS AND FEEDBACKS

-“These problems(around CO2) wouldn’t have occurred if there wasn’t excessive coal burning in the first place, right? So we need to stop that from the beginning.”

-“I thought that Fibershed’s enclosed manufacturing cycle was pretty cool!”

-“Is there a faster way to turn gaseous CO2 into solid carbon?”

-WHOA I didn’t know that soil could reverse climate change!!”

-“Do all plants work equally efficiently at fixating carbon?

-“I want to know the exact plans of a sustainable -agriculture farm. Like how exactly is it planned? What makes it better?”

-“Soil Not Oil sounds interesting... Maybe I’ll read it for English Extra Credit!”

Day 17

PRESENTATION

MY REFLECTION:

To be very honest, **at first I was very scared** about standing in front of the class and being a teacher. Climate Change is an old topic, and I was worried that my presentation wouldn't spark an interest. However, I was all wrong! **Everyone where all really intrigued by the new idea** that soil can hold CO₂, and the **conversation** at the end **really sparked a lot of new thoughts** that I hadn't even thought of.

Moreover, everyone was **super supportive**, and gave me all the attention as well as **being not afraid of putting forward their thoughts** on such an unconventional topic in school. **I had a lot of fun presenting**, and it was something new that I tried today, just like every other day that this PGC journey brought me on to! 😊

chriscat_gogreen #pgc2017 #soil

Look at the the beautiful greens that spreads across the mountains- I found myself immersed in the imagination of a fertile land with healthy people, touched by the clean, and CO2 free air. And this picture may depict the key to that future -today, I learned that soil fixates Carbon from the air, and can be a key factor in fighting climate change. After seeing countless organizations like @kissthegroundca and @turninggreenorg take on such a big challenge and strive for this great cause, I myself feels inspired to follow their lead as well.
