

Project Green Challenge : Part 2

Summary

Ikem-Nwosu Promise, Sophomore, Nigerian Maritime University, Okerenkoko, Nigeria

I focused on educating the public on what climate change is and its impact to our ecosystem, especially through the use of single-use plastics and fossil fuels. I published an article on sustainable development with a newspaper. I visited a very popular radio station in Delta State. I was offered the opportunity to share my knowledge with my campus' elementary school students. I talked to my campus community chief and chairman. I personally met with the Vice Chancellor of my school. I, and a marine environment and pollution control team in my department, spoke to my community about ocean conservation and environmental justice.

Following this, I provided waste receptacles and a landfill for my community to dispose of single-use plastics. Finally, I led the charge to install solar panels on my school to reduce its overdependence on fossil fuels. And all of this happened in just a couple of months.
