Day:20

What environmental topics are you most passionate about?

Air pollution, plastic pollution, food waste.

How is your school performing?

They literally don't care about these issues.

In what areas does it excel?

In terms of education, my school has very good teachers and students.

Where is there room for improvement?

We can pursue the students and teachers to recycling and using less energy, etc.

What issue speaks to you personally?

Plastic pollution

- What is the environmental focus you have selected?

Plastic pollution

- Why does your school need to improve in this area?

First of all, no one in my school really cares about their trash and even plastic pollution. Secondly there are very simple things that we can do in my school to make a big change.

- Who would you need to work with or call on to make a change?

School teachers and students and staffs.

- What are some specific recommendations for how this could improve?

putting recycle bins to recycle our trash in school, having some meetings with students to talk about environmental issues such as plastic pollution and air pollution.

- Are there examples of schools, campuses, or localities that do this well?

Yes, there are some organizations that recycle plastic.

- How can you use your skill set to create this change?

I can speak to the students and encourage them to act and think more about nature and what they do about environmental issues and put recycling bins.

Write up a proposal for your school around this issue that states the problem, plan of action, rationale, and solutions.

Plastics are amazing and since its inception, plastic has enabled countless advances in our industry and way of life. Created to be light, durable, chemically resistant, non-reactive to outside influences, and easy to manufacture, plastic was a perfect building material for countless articles that are used not only by ordinary users in their daily affairs but also in aeronautics, construction industry, electronics, packaging, transportation, energy conservation, scientific components and other.

But now we are using it too much and its disadvantages are greater than its advantages and by recycling it we can help a little bit.

When we recycle our trash in school, students will do that in their home and their parents and even their child in the future will learn from them. Furthermore, students will think more about environmental issues and little by little they will act on those issues. And all of it will happen through a simple change that is putting recycling bins in school.
