Take action for food insecurity

The USDA defines food insecurity as a lack of consistent access to enough food for every person in a household to live an active, healthy life. This can be a temporary situation for a family or can last a long time. Food insecurity is one way we measure how many people can't afford food.

Across the nation, severe flooding across the nation has wiped out food supplies for at least 3,000 households. Exceptionally heavy rainfall since the beginning of 2022 across seven of the ten districts in Suriname has caused more devastation than ever before, according to AFP newswire. Ongoing research has warned that deforestation in South America's Guiana Shield rainforest – which covers almost all of Suriname's landmass – will lead to increased rainfall across the region. According to Global Forest Watch, 12.3kilohectres of Surname's rainforest – equivalent to 10.1 megatons of Co2 emissions – have been lost in the last decade, and these underreported 2022 floods reiterate that climate change is impacting some of the world's most vulnerable communities (*Relief Efforts in Suriname: "The Main Supply of Food Has Gone." - Suriname*, 2022).

According to Helmer Haas, MAF Suriname's Office Manager, in Suriname's interior, crops are grown next to the rivers where people live. Rivers are their lifeline but burst riverbanks can destroy the cassava harvest, so their main supply of food will be gone. In the capital, many streets are flooded. People had to raise their beds and fridges at home, it's the worst it's ever been. On one journey the area wasn't too bad, but the water was about half a meter deep. Whenever a truck passed by, water splashed right over the cars. The water came in fast, and the engine could have died. But a broken-down car is an inconvenience in the city – in remote areas there is a lot of poverty. When water floods their homes, they cannot replace them.

According to Kevin Headley, the greengrocers' plant on higher plant beds than usual. Water systems are also used to keep crops moist during dry periods. Planting in other ways is also being looked at, such as planting in greenhouses with a focus on certain crops such as peppers, tomatoes, and lettuce.

According to Kevin Headley, the Ministry of Agriculture, Livestock and Fisheries works with the United Nations (UN), Food and Agriculture Organisation (FAO), the United Nations Development Programme (UNDP), and the Inter-American Institute for Agricultural Cooperation (IICA) to conduct research and projects on climate change in Suriname's agriculture.

The country is hardly guilty of greenhouse gas emissions, and the country is the most vulnerable due to its low coastal plain.

According to Food for Hunger, you can organize your own food drive. Let's work together to fight hunger in our hometown. You can also relocate industry to reduce food waste to fight hunger. Rescuing and donating meals for our neighbors in need is so important because millions of people need help today.
