

Single-use plastics are widely used in our quick-paced, convenience-focused culture, yet their production and disposal come at a tremendous environmental cost. Confronting the effects of our convenience-oriented lifestyles requires us to think about how harmfully single-use plastics are produced and used. At every stage of their life cycle, these plastics, which are frequently created from non-renewable resources, considerably contribute to pollution and environmental deterioration.

It is obvious that a significant change is required when one considers the enormous amounts of single-use plastics that are fouling our lands, clogging our oceans, and harming animals. We are in a critical stage where action and widespread awareness are required. It urges us to change the way we shop by urging us to select eco-friendly options and back companies that uphold these values.

But despite the enormity of the issue of plastic pollution and unsustainable, harmful production, it is imperative to recognize that every modest, thoughtful decision we make—from declining plastic straws to endorsing companies that use sustainable practices—helps the environment. As individuals, we have the ability to inspire others and create a future in which wasteful production and an excess of single-use plastics are relics of the past and are replaced by a more environmentally friendly and sustainable way of life.

We decided to include eco bricks in our art piece, which are further going to be used in our school's community garden! Eco bricks are a smart, conventional and creative way to reuse plastic!
