

Team Adobo, Zejin Chen, Singapore School Manila

Our oceans are vast, our problems in the ocean are just as vast as its size.

As individuals who live in a country of islands and are surrounded by the sea. The ocean is one of the biggest issues that we have on an everyday basis ranging from typhoons, destruction of coral reefs and problems with fishing.

Seafood is one of our main sources of food, and we clearly know how the prices of these foods change in response to the lack of demand due to the climate and pollution. Moreover, corals provide habitats for biodiversity and protect our land from the dangers of the sea. But because of climate change and improper handling of bodies of water, our corals are dying and are reflected in other ocean related issues.

With this we must work together to improve our water resources such as maintaining and restoring healthy marine and coastal ecosystems when traveling, reducing our overall greenhouse gas emissions, assist fishermen by making use of online apps for selling in the market, and most importantly prevent wastes in our bodies of water through avoiding littering and cleaning the sea.
